BOT

Authentication

Start making requests to the Recall API.

API Keys

API keys are used to authenticate to the Recall.ai platform.

You can create and manage your API keys in the Recall dashboard:

- [\(US\) us-east-1](#)
- [\(Pay-as-you-go\) us-west-2](#)
- [\(EU\) eu-central-1](#)
- [\(JP\) ap-northeast-1](#)

API keys belong to individual users, but access is environment-scoped. This means that multiple accounts under the same environment share access to the same resources, but have their own API keys.

HTTP Header: Token Authorization

Ask AI

All requests must be authenticated via token in the HTTP `Authorization` header in the following format:

```
Authorization: Token YOUR_API_KEY
```

For e.g if you Recall API Key is `abcdefghijklmnopqrst` then the following should be the authorization header

```
Authorization: Token abcdefghijklmnopqrst
```

Unauthenticated requests will receive a 401 error: `401: Unauthorized` .
